Received 25 November 1971

Accepted for publication 17 July 1972

Substituted aryl and 3-oxo-2*H*-pyridazin-5-yl alkane-, arene-, and phenylmethanesulfonates were synthesized and tested for insecticidal, acaricidal, ovicidal, fungicidal, and herbicidal efficacies.

Among the great many chemical preparations serving to chemical protection of agricultural produces, only a small number of aromatic sulfonates could be found. So far, 4-chlorophenyl benzenesulfonate as ovicide [1] and 4-chlorophenyl 4-chlorobenzenesulfonate, which has beside ovicidal also good acaricidal efficacy [2], have been practically used.

It is clear from many works in patent and technical literature that esters of sulfonic acid as pesticides have been thoroughly studied lately. Regarding the relatively good attainability of sulfonyl chlorides as well as substituted phenols and 5-hydroxy-2*H*-pyridazin-3-ones, we decided to prepare several esters of sulfonic acid (Scheme 1) chemically characterized in Tables 1–6, biologically in Tables 7–10 with purpose to test for biological activity.

R = methyl, ethyl, chloromethyl, 2,3-dichloropropyl, 2-chloroethyl, phenyl, 4-tolyl, 4-halogenophenyl, 2,3,4-trichlorophenyl, 2,4,5-trichlorophenyl, 3-nitrophenyl, and benzyl.

R¹ = chloro, methoxy, ethylthio, phenoxy.

R² = methyl, phenyl.

R³ = methyl, sec-butyl, cyclohexyl.

X = halo, nitro, cyano.

Scheme 1

General methods of ester preparation, mainly the reaction of the appropriate alkane- and arenesulfonyl chloride, respectively, with the sodium or potassium salt of the corresponding phenol or 5-hydroxy-2*H*-pyridazin-3-one were used to synthesize the compounds present in Tables 1–6. The resulting products were liquids or crystalline compounds that could be easily isolated.

Different procedure was used to prepare 2,6-dihalogeno-4-cyanophenyl esters. Phenol and sulfonyl chloride were treated with aqueous solution of alkaline hydroxide in a heterogeneous phase. The obtained products were white crystalline compounds.

^a Ref. [5] gives m.p. 171–171.5°C.^{**} Ref. [5] gives m.p. 152.3–152.6°C.a) Calculated: 18.55% Br;
found: 18.37% Br. b) Calculated: 26.53% I;
found: 26.95% I.

We found that pyridazinyl sulfonates (Table 1) showed orderly lower biological efficiency than the used standard.

2,6-Dihalogeno-4-cyanophenyl esters (Table 2) showed good herbicidal properties which were in some cases equal to those of the used standards. The most active from this group was 2,6-diiodo-4-cyanophenyl chloromethanesulfonate (*XXVIII*) (Table 10).

The herbicidal efficacy of 2,6-dihalogeno-3-alkyl-4-nitrophenyl esters (Table 3) was measurable but lower than that of the used standards. Remarkable was the acaricidal efficiency of 2,6-dibromo-4-nitrophenyl phenylmethanesulfonate (*LV*) which was only a little less active than the used standard (Table 7).

Some of the 2,4,6-substituted 3-methylphenyl esters (Table 4) showed measurable herbicidal efficacy but lower than the used standard. The acaricidal (Table 7) and mainly fungicidal efficacy of 2,6-dinitro-3-methyl-4-chlorophenyl 2-chloroethanesulfonate (*LXV*) to *Sclerotinia fructicola* (Wint.) Rehm (ED₅₀ 0.039, standard Kaptan 0.036) is worth mentioning.

Biologically the most interesting group was that of 2-alkyl-4,6-dinitrophenyl esters (Table 5) from which 2-alkyl-4,6-dinitrophenyl alkanesulfonates showed very good herbicidal efficacies being only a little lower than that of the used standard. On the other hand, halogenoalkanesulfonates were very effective as acaricides, even more efficient than the used standard. It concerned 2-sec-butyl-4,6-dinitrophenyl 2-chloroethanesulfonate (*LXXXIX*), the appropriate chloromethanesulfonate (*LXXXVII*), and 2,3-dichloropropanesulfonate (*XCI*) (Table 7). Similarly, their fungicidal efficacies were also very good. Compounds *LXXXVII* and *XCI* as seed-dressing were more effective than the used standard (Table 8).

Further tests with these compounds as seed-dressing are in progress. From this group of compounds, 2-(1-methylheptyl)-4,6-dinitrophenyl 2,4,5-trichlorobenzenesulfonate (*XCVI*) and the appropriate 2-chloroethanesulfonate (*XC*) (Table 9) were very efficient also as antipowdery mildew fungicides.

We failed to prove fungicidal and herbicidal efficacies of aryl sulfonates (Table 6) in conditions of our experiments. Measurable herbicidal activity was found only with 2,4,5-trichloro-6-nitrophenyl alkanesulfonates.

Experimental

The analytical and physical characteristics of the synthesized compounds are in Tables 1–6. Melting points were determined according to Kofler.

Pesticidal efficacies were determined according to [3, 4] and the following objects were used to test the synthesized compounds: Insecticidal efficacy was followed on *Musca domestica* L., *Calandra granaria* L., systemic insecticidal efficacy on *Macrosypho-*

nella sanborni Gillette, acaricidal efficacy on *Tetranychus urticae* Koch, ovicidal efficacy on the eggs of *Tetranychus urticae* Koch, and contact insecticidal efficacy on *Aphis fabae* Scop.

For determination and comparison of the fungicidal efficacies of the mentioned compounds, *in vitro* as well as *in vivo* methods were used. The inherent efficacy was followed on the spores of *Sclerotinia fructicola* (Wint.) Rehm (slide germination test) and on the spores of *Aspergillus niger* Tiegh., *Fusarium niveale* (Fr.) Ces., *Alternaria sp.*, and *Stemphylium sarcinoforme* (Cav.) Withshire fungi. The antipowdery mildew efficacy was tested on the living plants of spring barley, sort Dunajský trh (*Erysiphe graminis* DC.) and on cucumbers, sort Znojemské (*Erysiphe cichoracearum* DC.).

The herbicidal efficacy was determined by the method of preemergence (into the soil) and postemergence (to the leaf) application. The testing objects were: *Avena sativa* L., *Echinochloa crus-galli* L. P. Beauv., *Beta vulgaris* L., *Polygonum persicaria* L., *Chenopodium album* L., *Brassica napus* L., *Pisum sativum* L., *Avena fatua* L., *Hordeum sativum* L., *Vicia sativa* L., *Fagopyrum sagittatum* L., *Sinapis alba* L., *Amaranthus retroflexus* L., *Linum usitatissimum* L., *Zea mays* L., and *Triticum sativum* L.

Esters of alkane-, arene-, and phenylmethanesulfonic acid (I—XXII, XL—CXVII)

The corresponding sulfonyl chloride (0.1 mole) was added to sodium or potassium salt of the appropriate phenol or 5-hydroxy-2*H*-pyridazin-3-one (0.1 mole) in acetone (ethyl methyl ketone, acetonitrile, or tetrahydrofuran) (100 ml) under stirring at 15—20°C. This solution was stirred for 1 hour at 20—25°C and then for 1—6 hours under reflux. The formed sodium or potassium chloride was filtered off and the filtrate evaporated under reduced pressure. Benzene or toluene (100—150 ml) was added to the residue, washed with water, 5% solution of sodium carbonate, and water. After drying with sodium sulfate, the solvent was distilled off under reduced pressure. The residue was dried *in vacuo* at 0.3 torr and bath temperature 90°C for 2 hours. The obtained solid was purified by crystallization.

2,6-Dihalogeno-4-cyanophenyl alkane- and arenesulfonates (XXXIII—XXXIX)

2,6-Dihalogeno-4-cyanophenol (0.07 mole) was added to sodium hydroxide (0.077 mole) in water (80 ml) and then at 60°C the appropriate sulfonyl chloride (0.07 mole) was added. The temperature was allowed to rise to 93°C and the reaction mixture stirred for 30 minutes. After cooling the solution to 16°C, the obtained product was filtered, washed with water, dried, and crystallized.
